testing, palpation, orthopedic testing, basic neurological testing, postural analysis testing, muscle strength testing, radiographic studies, scanning of feet, EMS, exercises, acupuncture, myofascial treatments, hot/cold therapy, mechanical traction, traction/decompression, laser therapy, vibrational pivot platform, or cranial balloon adjustments (CFR). By accepting this document you are consenting to these procedures as recommended/prescribed by this clinic. The material risks inherent in chiropractic adjustment. It is important that you understand, as with all health care approaches, results are not guaranteed, and there is no promise to cure. As with all types of health care interventions, there are some risks to care, including, but not limited to: muscle spasms, aggravating and/or temporary increase in symptoms, lack of improvement of symptoms, burns and/or scarring from electrical stimulation or from hot or cold therapies, including but not limited to hot packs and ice, fractures (broken bones), disc injuries, strokes, dislocations, strains, and sprains. With respect to strokes, there is a rare but serious condition known as an 'arterial dissection' that typically is caused by a tear in the inner layer of the artery that may cause the development of a thrombus (clot) with the potential to lead to a stroke. The best available scientific evidence supports the understanding that chiropractic adjustment does not cause a dissection in a normal, healthy artery. Disease processes, genetic disorders, medications, and vessel abnormalities may cause an artery to be more susceptible to dissection. Strokes caused by arterial dissections have been associated with over 72 everyday activities such as sneezing, driving, and playing tennis. The probability of those risks occurring. Fractures are rare occurrences and generally result from some underlying weakness of the bone which the provider will check during the taking of your history during examination and X-ray. Arterial dissections occur in 3-4 of every 100,000 people whether they are receiving health care or not. Patients who experience this condition often, but not always, present to their medical doctor or chiropractor with neck pain and headache. Unfortunately a percentage of these patients will experience a stroke. The reported association between chiropractic visits and stroke is exceedingly rare and is estimated to be one in one million to one in two million cervical adjustments. For comparison, the incidence of hospital admissions attributed to aspirin use from major GI events of the entire (upper and lower) GI tract was 1219 events/ per one million persons and the risk of death has been estimated at 140 per one million users. The availability and nature of other treatment options. Other treatment options for your condition may include:

- Self-administered, over-the-counter analgesics and rest
- Medical care and prescription drugs such as anti-inflammatories, muscle relaxants, and pain-killers
- Hospitalization
- Surgery

If you chose to use one of the above noted other treatment options you should be aware that there are risks and benefits of such options and you may wish to discuss these with your primary medical physician. The risks and dangers to remaining untreated. Remaining untreated may allow the formulation of adhesions and reduce mobility which may set up a pain reaction further reducing mobility. Over time this process may complicate treatment, making it more difficult and less effective the longer it is postponed. I have read or have had read to me the above explanation of the chiropractic adjustment and related treatment. I have discussed with the clinic any questions and concerns I have and they have been answered to my satisfaction. By accepting, I state that I have weighed the risks involved in undergoing treatment and have decided that it is in my best interest to undergo the treatment recommended. Having been informed of the risks, I hereby give my consent to that treatment.
